

Design and Production of Tooling & Equipment

When it comes to the design and production of tooling and equipment tailored to the needs of an aircraft operator or MRO facility, Lufthansa Technik's Tool and Equipment Engineering is the partner of choice.

Description

Based on decades of experience, we know that original equipment manufacturer (OEM) tools and equipment seldom match the specific requirements of an individual airline or the work processes of an MRO organization. But tools tailored to specific requirements are not available on the market as standard products. The experts from Lufthansa Technik know first-hand that the best concepts for suitable tooling and equipment usually originate from a business's own staff. However, to implement these ideas on functionality drawn from the experience of day-to-day work and use them on an aircraft or aircraft component, they have to comply with the aviation and health and safety regulatory framework.

As a customer of Lufthansa Technik's Tool & Equipment Engineering you benefit here from a wealth of experience accumulated over half a century. Our aspiration is to provide you with customized and practical tooling and equipment that reconcile the demands of cost-effectiveness, legal compliance, quality and environmental protection.

Lufthansa Technik is the partner of choice when it comes to transforming your specific ideas and requirements into the practical reality of a truly efficient technical operation. At the end you will have a solution tailored to your requirements. The top-quality tooling and equipment that we manufacture is supplied with legally compliant technical documentation.

Tool and Equipment Engineering

Tool and Equipment Engineering is part of the Lufthansa Technik Design Organization (EASA 21/J). The department is approved to design maintenance tools for the commonest aircraft types and can offer you approved and certified alternatives to OEM tools and equipment.

Customer advantages

- Solutions that comply with the pertinent legal requirements
- Specific, customized and cost-efficient
- Everything from a single source
