

The fast track to connectivity

Lconnect FlexMod is the easy way to get your fleet connected. Our mobile team takes care of everything from hardware selection support and modification scheduling to implementation at any maintenance facility you choose. The all-inclusive mobile program of production consulting and modification support guarantees a hassle-free upgrade of your fleet to the world of connectivity.

Planning and implementing a connectivity solution can be a daunting task. A lot of stakeholders are involved, which means that harmonizing the requirements of airlines, suppliers and – not least – the maintenance team is quite demanding. In addition, highly utilized hangars, due to the bottleneck caused by the global hangar and MRO capacity, are often too expensive for such modifications. As a result, the implementation of fleet connectivity modification programs often takes a lot of time.

Production consulting

Our experts analyze your operational profile and – in cooperation with your own specialists – map out the optimum retrofit solution. While planning the concrete modification, your flight plan and the available maintenance facilities – preferably close to your base – are taken into account. We continuously manage the contributions of each party involved, bring them together and solve all problems. This goes as far as searching for or even providing the qualified modification crew, should the need arise.

Mobile modification crew

We support you on site and take along our planning staff, production engineers and qualified Lufthansa Technik mechanics. Our well-trained mechanics, who specialize in performing connectivity modifications and bring their own tools and equipment with them, can be sent to any modification facility in the world.

Our industry expertise and in-depth knowledge of different aircraft types and modification programs enable us to offer the optimal solution in terms of planning and implementation. Possible modification models include the work being carried out during scheduled airframe maintenance (C-check) or within the framework of a mobile modification event (turnaround time: two to six days). The possibility of performing modifications during night stops is under consideration as a potential capability expansion in the future.

Customer advantages

- Qualified experience in mobile modification services
- Large network to cover even the most extensive fleet programs (200+ a/c)
- Partner network for staff and hangars
- Part-21 capabilities (facilities, qualifications, etc.)
- Reliable project completion
